Deviated Conductor

Features and benefits

- Expro provides deviated conductor pipe with a predetermined direction and deviation
- The conductor pipe can be designed to achieve between one and four degrees of angled deviation per 100 feet of penetration, given customer and geological specifications
- Allows new conductors to be driven without interference with existing conductors from the same platform
- Allows for the use of standard conductor pipe, which eliminates the need for special pre-curved pipe
- Uses the existing guide template of the platform without the need of special offset guides
- Expro can fabricate and install shoes to the exact standards that minimize side deviation
- Can be combined with Expro's SPEED SHOE® Drive Shoe

Applications

The basic system is custom-designed based on the following criteria:

- Objective (deviation, dispersal, or drive-around)
- Pipe size, thickness and grade
- Degree of desired deviation
- Soil data and driveability
- Type of joint connections (threaded or welded)
- Location and diameter of platform guides (if applicable)
